SHARP ERROR BOUNDS IN APPROXIMATING THE RIEMANN-STIELTJES INTEGRAL BY A GENERALISED TRAPEZOID FORMULA AND APPLICATIONS

P. CERONE AND S.S. DRAGOMIR

ABSTRACT. Sharp error bounds in approximating the Riemann-Stieltjes integral $\int_a^b f(t) du(t)$ with the generalised trapezoid formula $f(b) \left[u(b) - \frac{1}{b-a} \int_a^b u(s) ds \right] + f(a) \left[\frac{1}{b-a} \int_a^b u(s) ds - u(a) \right]$ for various pairs (f, u) of functions are given. Applications for weighted integrals are also provided.

1. INTRODUCTION

In [8], in order to approximate the Riemann-Stieltjes integral $\int_a^b f(t) du(t)$ by the *generalised trapezoid formula*

$$(1.1) \quad [u(b) - u(x)] f(b) + [u(x) - u(a)] f(a), \quad x \in [a, b]$$

the authors considered the error functional

$$(1.2) \quad T(f, u; a, b; x) := \int_a^b f(t) du(t) - [u(b) - u(x)] f(b) - [u(x) - u(a)] f(a)$$

and proved that

$$(1.3) \quad |T(f, u; a, b; x)| \leq H \left[\frac{1}{2} (b-a) + \left| x - \frac{a+b}{2} \right| \right]^r \bigvee_a^b(f), \quad x \in [a, b],$$

provided that $f : [a, b] \rightarrow \mathbb{R}$ is of bounded variation on $[a, b]$ and u is of r - H -Hölder type, that is, $u : [a, b] \rightarrow \mathbb{R}$ satisfies the condition $|u(t) - u(s)| \leq H |t - s|^r$ for any $t, s \in [a, b]$, where $r \in (0, 1]$ and $H > 0$ are given.

The dual case, namely, when f is of q - K -Hölder type and u is of bounded variation has been considered by the authors in [2] in which they obtained the bound:

$$(1.4) \quad |T(f, u; a, b; x)| \leq K \left[(x-a)^q \bigvee_a^x(u) + (b-x)^q \bigvee_x^b(u) \right]$$

Key words and phrases. Riemann-Stieltjes integral, Trapezoid rule, Integral inequalities, Weighted integrals.

$$\leq \begin{cases} K[(x-a)^q + (b-x)^q] \left[\frac{1}{2} V_a^b(u) + \frac{1}{2} |V_a^x(u) - V_x^b(u)| \right]; \\ K[(x-a)^{q\alpha} + (b-x)^{q\alpha}]^{\frac{1}{\alpha}} \left[[V_a^x(u)]^\beta - [V_x^b(u)]^\beta \right]^{\frac{1}{\beta}} \\ \quad \text{if } \alpha > 1, \frac{1}{\alpha} + \frac{1}{\beta} = 1; \\ K \left[\frac{1}{2} (b-a) + \left| x - \frac{a+b}{2} \right| \right]^q V_a^b(u), \end{cases}$$

for any $x \in [a, b]$.

The case where f is monotonic and u is of $r-H$ -Hölder type, which provides a refinement for (1.3), respectively the case where u is monotonic and f of $q-K$ -Hölder type were considered by Cheung and Dragomir in [5], while the case where one function was of Hölder type and the other was Lipschitzian were considered in [1]. For other recent results in estimating the error $T(f, u; a, b, x)$ for absolutely continuous integrands f and integrators u of bounded variation, see [3] and [4].

The main aim of the present paper is to investigate the error bounds in approximating the Stieltjes integral by a different generalised trapezoid rule than the one from (1.1) in which the value $u(x)$, $x \in [a, b]$ is replaced with the integral mean $\frac{1}{b-a} \int_a^b u(s) ds$. Applications in approximating the weighted integrals $\int_a^b h(t) f(t) dt$ are also provided.

2. REPRESENTATION RESULTS

We consider the following error functional $T_g(f; u)$ in approximating the Riemann-Stieltjes integral $\int_a^b f(t) du(t)$ by the generalised trapezoid formula

$$\begin{aligned} & f(b) \left[u(b) - \frac{1}{b-a} \int_a^b u(t) dt \right] + f(a) \left[\frac{1}{b-a} \int_a^b u(t) dt - u(a) \right], \\ (2.1) \quad T_g(f; u) &:= f(b) \left[u(b) - \frac{1}{b-a} \int_a^b u(t) dt \right] \\ & \quad + f(a) \left[\frac{1}{b-a} \int_a^b u(t) dt - u(a) \right] - \int_a^b f(t) du(t). \end{aligned}$$

If we consider the associated functions Φ_f, Γ_f and Δ_f defined by

$$\begin{aligned} \Phi_f(t) &:= \frac{(t-a)f(b) + (b-t)f(a)}{b-a} - f(t), \quad t \in [a, b], \\ \Gamma_f(t) &:= (t-a)[f(b) - f(t)] - (b-t)[f(t) - f(a)], \quad t \in [a, b] \end{aligned}$$

and

$$\Delta_f(t) := \frac{f(b) - f(t)}{b-t} - \frac{f(t) - f(a)}{t-a}, \quad t \in (a, b),$$

then we observe that

$$(2.2) \quad \Phi_f(t) = \frac{1}{b-a} \Gamma_f(t) = \frac{(b-t)(t-a)}{b-a} \Delta_f(t), \quad \text{for any } t \in (a, b).$$

The following representation result can be stated.

Theorem 1. *let $f, u : [a, b] \rightarrow \mathbb{R}$ be bounded on $[a, b]$ and such that the Riemann-Stieltjes integral $\int_a^b f(t) du(t)$ and the Riemann integral $\int_a^b u(t) dt$ exist. Then we have the identities:*

$$(2.3) \quad \begin{aligned} T_g(f; u) &= \int_a^b \Phi_f(t) du(t) = \frac{1}{b-a} \int_a^b \Gamma_f(t) du(t) \\ &= \frac{1}{b-a} \int_a^b (b-t)(t-a) \Delta_f(t) du(t) = D(u; f), \end{aligned}$$

where

$$(2.4) \quad D(u; f) = \int_a^b u(t) df(t) - [f(b) - f(a)] \cdot \frac{1}{b-a} \int_a^b u(t) dt.$$

Proof. Integrating the Riemann-Stieltjes integral by parts, we have

$$\begin{aligned} &\int_a^b \Phi_f(t) du(t) \\ &= \int_a^b \left[\frac{f(a)(b-t) + f(b)(t-a)}{b-a} - f(t) \right] du(t) \\ &= \frac{1}{b-a} \left\{ [f(a)(b-t) + f(b)(t-a)] u(t) \Big|_a^b \right. \\ &\quad \left. - \int_a^b u(t) d[f(a)(b-t) + f(b)(t-a)] \right\} - \int_a^b f(t) du(t) \\ &= \frac{1}{b-a} \left\{ [f(b)u(b) - f(a)u(a)](b-a) - [f(b) - f(a)] \int_a^b u(t) dt \right\} - \int_a^b f(t) du(t) \\ &= f(b) \left[u(b) - \frac{1}{b-a} \int_a^b u(t) dt \right] + f(a) \left[\frac{1}{b-a} \int_a^b u(t) dt - u(a) \right] \\ &= T_g(f; u), \end{aligned}$$

and the first equality in (2.3) is proved.

The second and third identity is obvious by the relation (2.2).

For the last equality, we use the fact that for any $g, h : [a, b] \rightarrow \mathbb{R}$ bounded functions for which the Riemann-Stieltjes integral $\int_a^b h(t) dg(t)$ and the Riemann integral $\int_a^b g(t) dt$ exist, we have the representation (see for instance [6])

$$(2.5) \quad D(g; h) = \int_a^b \Phi_h(t) dg(t).$$

The proof is now complete. ■

In the case where u is an integral, the following identity can be stated.

Corollary 1. *Let $p, h : [a, b] \rightarrow \mathbb{R}$ be continuous on $[a, b]$ and $f : [a, b] \rightarrow \mathbb{R}$ be Riemann integrable. Then we have the identity:*

$$\begin{aligned}
 (2.6) \quad T_g \left(f; \int_a^b ph \right) &= \frac{1}{b-a} \left[f(b) \cdot \int_a^b (t-a) p(t) h(t) dt + f(a) \cdot \int_a^b (b-t) p(t) h(t) dt \right] \\
 &\quad - \int_a^b p(t) f(t) h(t) dt \\
 &= \int_a^b \Phi_f(t) p(t) h(t) dt.
 \end{aligned}$$

Proof. Since p and h are continuous, the function $u(t) = \int_a^t p(s) h(s) ds$ is differentiable and $u'(t) = p(t) h(t)$ for each $t \in (a, b)$.

Integrating by parts, we have

$$\begin{aligned}
 \int_a^b u(t) dt &= \left(\int_a^t p(s) h(s) ds \right) \cdot t \Big|_a^b - \int_a^b t p(t) h(t) dt \\
 &= b \int_a^b p(s) h(s) ds - \int_a^b t p(t) h(t) dt \\
 &= \int_a^b (b-t) p(t) h(t) dt.
 \end{aligned}$$

Since

$$\begin{aligned}
 u(b) - \frac{1}{b-a} \int_a^b u(t) dt &= \int_a^b p(t) h(t) dt - \frac{1}{b-a} \int_a^b (b-t) p(t) h(t) dt \\
 &= \frac{1}{b-a} \int_a^b (t-a) p(t) h(t) dt,
 \end{aligned}$$

then, by the definition of T_g in (2.1), we deduce the first part of (2.6).

The second part of (2.6) follows by (2.3). ■

Remark 1. *In the particular case $p(t) = 1$, $t \in [a, b]$, we have the equality:*

$$\begin{aligned}
 (2.7) \quad T_g \left(f; \int_a^b h \right) &= \frac{1}{b-a} \left[f(b) \cdot \int_a^b (t-a) h(t) dt + f(a) \cdot \int_a^b (b-t) h(t) dt \right] \\
 &\quad - \int_a^b f(t) h(t) dt \\
 &= \int_a^b \Phi_f(t) h(t) dt = \frac{1}{b-a} \int_a^b \Gamma_f(t) h(t) dt.
 \end{aligned}$$

3. SOME INEQUALITIES FOR f -CONVEX

The following result concerning the nonnegativity of the error functional $T_g(\cdot; \cdot)$ can be stated.

Theorem 2. *If u is monotonic nonincreasing and $f : [a, b] \rightarrow \mathbb{R}$ is such that the Riemann-Stieltjes integral $\int_a^b f(t) du(t)$ exists and*

$$(3.1) \quad \frac{f(b) - f(t)}{b - t} \geq \frac{f(t) - f(a)}{t - a}, \quad \text{for any } t \in (a, b),$$

then $T_g(f; u) \geq 0$, or, equivalently

$$(3.2) \quad f(b) \left[u(b) - \frac{1}{b-a} \int_a^b u(t) dt \right] + f(a) \left[\frac{1}{b-a} \int_a^b u(t) dt - u(a) \right] \geq \int_a^b f(t) du(t).$$

A sufficient condition for (3.1) to hold is that f is convex on $[a, b]$.

Proof. The condition (3.1) is equivalent with the fact that $\Delta_f(t) \geq 0$ for any $t \in (a, b)$ and then, by the equality

$$T_g(f; u) = \frac{1}{b-a} \int_a^b (b-t)(t-a) \Delta_f(t) du(t)$$

we deduce that $T_g(f; u) \geq 0$.

If f is convex, then

$$\frac{t-a}{b-a} f(b) + \frac{b-t}{b-a} f(a) \geq f \left[\left(\frac{t-a}{b-a} \right) b + \left(\frac{b-t}{b-a} \right) a \right] = f(t)$$

which shows that $\Phi_f(t) \geq 0$, namely, the condition (3.1) is satisfied. ■

Corollary 2. *Let $p, h : [a, b] \rightarrow \mathbb{R}$ be continuous on $[a, b]$ and $f : [a, b] \rightarrow \mathbb{R}$ Riemann integrable. If $p(t)h(t) \geq 0$ for any $t \in [a, b]$ and f satisfies (3.1) or, sufficiently, f is convex on $[a, b]$, then*

$$(3.3) \quad \frac{1}{b-a} \left[f(b) \cdot \int_a^b (t-a) p(t) h(t) dt + f(a) \cdot \int_a^b (b-t) p(t) h(t) dt \right] \geq \int_a^b p(t) f(t) h(t) dt.$$

We are now able to provide some new results.

Theorem 3. *Assume that p and h are continuous and synchronous (asynchronous) on (a, b) , i.e.,*

$$(3.4) \quad (p(t) - p(s))(h(t) - h(s)) \geq (\leq) 0, \quad \text{for any } t, s \in [a, b].$$

If f satisfies (3.1) and is Riemann integrable on $[a, b]$ (or sufficiently, f is convex on $[a, b]$), then

$$(3.5) \quad T_g \left(f; \int_a^p \right) \cdot T_g \left(f; \int_a^h \right) \leq (\geq) T_g \left(f; \int_a^1 \right) \cdot T_g \left(f; \int_a^{ph} \right)$$

where

$$(3.6) \quad T_g \left(f; \int_a^1 \right) = \frac{f(a) + f(b)}{2} (b-a) - \int_a^b f(t) dt.$$

Proof. We use the Čebyšev inequality:

$$(3.7) \quad \int_a^b \alpha(t) dt \int_a^b \alpha(t) p(t) h(t) dt \geq (\leq) \int_a^b \alpha(t) p(t) dt \int_a^b \alpha(t) h(t) dt,$$

which holds for synchronous (asynchronous) functions p, h and nonnegative α for which the involved integrals exist.

Now, on applying the Čebyšev inequality (3.7) for $\alpha(t) = \Phi_f(t) \geq 0$ and utilising the representation result (2.6), we deduce the desired inequality (3.5). ■

We also have:

Theorem 4. *Assume that $f : [a, b] \rightarrow \mathbb{R}$ is Riemann integrable and satisfies (3.1) (or sufficiently, f is concave on $[a, b]$). Then for $p, h : [a, b] \rightarrow \mathbb{R}$ continuous, we have*

$$(3.8) \quad \left| T_g \left(f; \int_a^b ph \right) \right| \leq \sup_{t \in [a, b]} |h(t)| T_g \left(f; \int_a^b |p| \right)$$

and

$$(3.9) \quad \left| T_g \left(f; \int_a^b ph \right) \right| \leq \left[T_g \left(f; \int_a^b |p|^\alpha \right) \right]^{\frac{1}{\alpha}} \left[T_g \left(f; \int_a^b |h|^\beta \right) \right]^{\frac{1}{\beta}}$$

where $\alpha > 1$, $\frac{1}{\alpha} + \frac{1}{\beta} = 1$. In particular, we have

$$(3.10) \quad \left| T_g \left(f; \int_a^b ph \right) \right|^2 \leq T_g \left(f; \int_a^b |p|^2 \right) T_g \left(f; \int_a^b |h|^2 \right).$$

Proof. Observe that

$$\begin{aligned} \left| T_g \left(f; \int_a^b ph \right) \right| &= \left| \int_a^b \Phi_f(t) p(t) h(t) dt \right| \\ &\leq \int_a^b |\Phi_f(t) p(t) h(t)| dt \\ &= \int_a^b \Phi_f(t) |p(t)| |h(t)| dt \\ &\leq \sup_{t \in [a, b]} |h(t)| \int_a^b \Phi_f(t) |p(t)| dt \\ &= \sup_{t \in [a, b]} |h(t)| T_g \left(f; \int_a^b |p| \right) \end{aligned}$$

and the inequality (3.8) is proved.

Further, by the Hölder inequality, we also have

$$\begin{aligned} \left| T_g \left(f; \int_a^b ph \right) \right| &\leq \int_a^b \Phi_f(t) |p(t)| |h(t)| dt \\ &\leq \left(\int_a^b \Phi_f(t) |p(t)|^\alpha dt \right)^{\frac{1}{\alpha}} \left(\int_a^b \Phi_f(t) |h(t)|^\beta dt \right)^{\frac{1}{\beta}} \\ &= \left[T_g \left(f; \int_a^b |p|^\alpha \right) \right]^{\frac{1}{\alpha}} \left[T_g \left(f; \int_a^b |h|^\beta \right) \right]^{\frac{1}{\beta}} \end{aligned}$$

for $\alpha > 1$, $\frac{1}{\alpha} + \frac{1}{\beta} = 1$, and the theorem is proved. ■

Remark 2. The above result can be useful for providing some error estimates in approximating the weighted integral $\int_a^b h(t) f(t) dt$ by the generalised trapezoid rule

$$\frac{1}{b-a} \left[f(b) \cdot \int_a^b (t-a) h(t) dt + f(a) \cdot \int_a^b (b-t) h(t) dt \right]$$

as follows:

$$(3.11) \quad \left| \frac{1}{b-a} \left[f(b) \cdot \int_a^b (t-a) h(t) dt + f(a) \cdot \int_a^b (b-t) h(t) dt \right] - \int_a^b h(t) f(t) dt \right| \leq \sup_{t \in [a,b]} |h(t)| \left[\frac{f(a) + f(b)}{2} (b-a) - \int_a^b f(t) dt \right],$$

provided f satisfies (3.1) and is Riemann integrable (or, sufficiently convex on $[a, b]$), which is continuous on $[a, b]$.

If $h(t) = |w(t)|^{\frac{1}{\beta}}$, $t \in [a, b]$, then for some f we also have

$$(3.12) \quad \left| \frac{1}{b-a} \left[f(b) \int_a^b (t-a) |w(t)|^{\frac{1}{\beta}} dt + f(a) \int_a^b (b-t) |w(t)|^{\frac{1}{\beta}} dt \right] - \int_a^b |w(t)|^{\frac{1}{\beta}} f(t) dt \right| \leq \left[\frac{f(a) + f(b)}{2} (b-a) - \int_a^b f(t) dt \right]^{\frac{1}{\alpha}} \times \left\{ \frac{1}{b-a} \left[f(b) \int_a^b (t-a) |w(t)| dt + f(a) \int_a^b (b-t) |w(t)| dt \right] - \int_a^b |w(t)| f(t) dt \right\}^{\frac{1}{\beta}},$$

with $\alpha > 1$, $\frac{1}{\alpha} + \frac{1}{\beta} = 1$.

Finally, we can state the following Jensen type inequality for the error functional $T_g \left(f; \int_a^b h \right)$.

Theorem 5. Assume $f : [a, b] \rightarrow \mathbb{R}$ is Riemann integrable and satisfies (3.1) (or sufficiently, f is convex on $[a, b]$), while $h : [a, b] \rightarrow \mathbb{R}$ is continuous. If $F : \mathbb{R} \rightarrow \mathbb{R}$ is convex(concave) then

$$(3.13) \quad F \left(\frac{T_g \left(f; \int_a^b h \right)}{T_g \left(f; \int_a^b 1 \right)} \right) \leq (\geq) \frac{T_g \left(f; \int_a^b F \circ h \right)}{T_g \left(f; \int_a^b 1 \right)}.$$

Proof. By the use of Jensen's integral inequality, we have

$$(3.14) \quad F \left(\frac{\int_a^b \Phi_f(t) h(t) dt}{\int_a^b \Phi_f(t) dt} \right) \leq (\geq) \frac{\int_a^b \Phi_f(t) F(h(t)) dt}{\int_a^b \Phi_f(t) dt}.$$

Since, by the identity (2.6), we have

$$\int_a^b \Phi_f(t) F(h(t)) dt = T_g \left(f; \int_a^b F \circ h \right),$$

then (3.14) is equivalent with the desired result (3.13). ■

4. SHARP BOUNDS VIA GRÜSS TYPE INEQUALITIES

Due to the identity (2.3) in which the error bound $T_g(f; u)$ can be represented as $D(u; f)$, where

$$D(u; f) = \int_a^b u(t) df(t) - [f(b) - f(a)] \cdot \frac{1}{b-a} \int_a^b u(t) dt,$$

is a Grüss type functional introduced in [9], any sharp bound for $D(u; f)$ will be a sharp bound for $T_g(f; u)$.

We can state the following result.

Theorem 6. *Let $f, u : [a, b] \rightarrow \mathbb{R}$ be bounded functions on $[a, b]$.*

- (i) *If there exists the constants n, N such that $n \leq u(t) \leq N$ for any $t \in [a, b]$, u is Riemann integrable and f is K -Lipschitzian ($K > 0$) then*

$$(4.1) \quad |T_g(f; u)| \leq \frac{1}{2} K (N - n) (b - a).$$

The constant $\frac{1}{2}$ is best possible in (4.1).

- (ii) *If f is of bounded variation and u is S -Lipschitzian ($S > 0$), then*

$$(4.2) \quad |T_g(f; u)| \leq \frac{1}{2} S (b - a) \bigvee_a^b(f).$$

The constant $\frac{1}{2}$ is best possible in (4.2)

- (iii) *If f is monotonic nondecreasing and u is S -Lipschitzian, then*

$$(4.3) \quad \begin{aligned} |T_g(f; u)| &\leq \frac{1}{2} S (b - a) [f(b) - f(a) - P(f)] \\ &\leq \frac{1}{2} S (b - a) [f(b) - f(a)], \end{aligned}$$

where

$$P(f) = \frac{4}{(b-a)^2} \int_a^b \left(t - \frac{a+b}{2} \right) f(t) dt.$$

The constant $\frac{1}{2}$ is best possible in both inequalities.

- (iv) *If f is monotonic nondecreasing and u is of bounded variation and such that the Riemann-Stieltjes integral $\int_a^b f(t) du(t)$ exists, then*

$$(4.4) \quad |T_g(f; u)| \leq [f(b) - f(a) - Q(f)] \bigvee_a^b(u),$$

where

$$Q(f) := \frac{1}{b-a} \int_a^b \operatorname{sgn} \left(t - \frac{a+b}{2} \right) f(t) dt.$$

The inequality (4.4) is sharp.

- (v) if f is continuous and convex on $[a, b]$ and u is of bounded variation on $[a, b]$, then

$$(4.5) \quad |T_g(f; u)| \leq \frac{1}{4} [f'_-(b) - f'_+(a)] \bigvee_a^b(u).$$

The constant $\frac{1}{4}$ is sharp (if $f'_-(b)$ and $f'_+(a)$ are finite).

- (vi) If $f : [a, b] \rightarrow \mathbb{R}$ is continuous and convex on $[a, b]$ and u is monotonic nondecreasing on $[a, b]$, then

$$(4.6) \quad \begin{aligned} 0 &\leq T_g(f; u) \\ &\leq 2 \cdot \frac{f'_-(b) - f'_+(a)}{b - a} \cdot \int_a^b \left(t - \frac{a+b}{2}\right) u(t) dt \\ &\leq \begin{cases} \frac{1}{2} [f'_-(b) - f'_+(a)] \max\{|u(a)|, |u(b)|\} (b - a); \\ \frac{1}{(q+1)^{1/q}} [f'_-(b) - f'_+(a)] \|u\|_p (b - a)^{1/q} & \text{if } p > 1, \frac{1}{p} + \frac{1}{q} = 1; \\ [f'_-(b) - f'_+(a)] \|u\|_1. \end{cases} \end{aligned}$$

The constants 2 and $\frac{1}{2}$ are best possible in (4.6) (if $f'_-(b)$ and $f'_+(a)$ are finite).

Proof. The inequality (4.1) follows from the inequality (2.5) in [9] applied for $D(u; f)$, while (4.2) comes from (1.3) of [10]. The inequalities (4.3) and (4.4) follow from [6], while (4.5) and (4.6) are valid via the inequalities (2.8) and (2.1) from [7] applied for the functional $D(u; f)$. The details are omitted. ■

If we consider the error functional in approximating the weighted integral $\int_a^b h(t) f(t) dt$ by the generalised trapezoid formula,

$$\frac{1}{b-a} \left[f(b) \cdot \int_a^b (t-a) h(t) dt + f(a) \cdot \int_a^b (b-t) h(t) dt \right],$$

namely, (see also (2.7))

$$(4.7) \quad \begin{aligned} E(f; h) &:= T_g \left(f; \int_a^b h \right) \\ &= \frac{1}{b-a} \left[f(b) \cdot \int_a^b (t-a) h(t) dt + f(a) \cdot \int_a^b (b-t) h(t) dt \right] \\ &\quad - \int_a^b h(t) f(t) dt, \end{aligned}$$

then the following corollary provides various sharp bounds for the absolute value of $E(f; h)$.

Corollary 3. Assume that f and u are Riemann integrable on $[a, b]$.

- (i) If there exists the constants γ, Γ such that $\gamma \leq \int_a^t h(s) ds \leq \Gamma$ for each $t \in [a, b]$, and f is K -Lipschitzian on $[a, b]$, then

$$(4.8) \quad |E(f; h)| \leq \frac{1}{2} K (\Gamma - \gamma) (b - a).$$

The constant $\frac{1}{2}$ is best possible in (4.8).

(ii) If f is of bounded variation and $|h(t)| \leq M$ for each $t \in [a, b]$, then

$$(4.9) \quad |E(f; h)| \leq \frac{1}{2} M (b - a) \bigvee_a^b(f).$$

The constant $\frac{1}{2}$ is best possible in (4.9).

(iii) If f is monotonic nondecreasing and $|h(t)| \leq M$, $t \in [a, b]$, then

$$(4.10) \quad \begin{aligned} |E(f; h)| &\leq \frac{1}{2} M (b - a) [f(b) - f(a) - P(f)] \\ &\leq \frac{1}{2} M (b - a) [f(b) - f(a)], \end{aligned}$$

where $P(f)$ is defined in Theorem 6. The constant $\frac{1}{2}$ is sharp in both inequalities.

(iv) If f is monotonic nondecreasing and $\int_a^b |h(t)| dt < \infty$, then

$$(4.11) \quad |E(f; h)| \leq [f(b) - f(a) - Q(f)] \int_a^b |h(t)| dt,$$

where $Q(f)$ is defined in Theorem 6. The inequality (4.11) is sharp.

(v) If f is continuous and convex on $[a, b]$, and $\int_a^b |h(t)| dt < \infty$, then

$$(4.12) \quad |E(f; h)| \leq \frac{1}{4} [f'_-(b) - f'_+(a)] \int_a^b |h(t)| dt.$$

The constant $\frac{1}{4}$ is sharp (if $f'_-(b)$ and $f'_+(a)$ are finite).

(vi) If $f : [a, b] \rightarrow \mathbb{R}$ is continuous and convex on $[a, b]$ and $h(t) \geq 0$ for $t \in [a, b]$, then

$$(4.13) \quad \begin{aligned} 0 &\leq E(f; h) \\ &\leq \frac{f'_-(b) - f'_+(a)}{b - a} \int_a^b (b - t)(t - a) h(t) dt \\ &\leq \begin{cases} \frac{1}{2} [f'_-(b) - f'_+(a)] (b - a) \int_a^b h(t) dt; \\ \frac{1}{(q+1)^{1/q}} [f'_-(b) - f'_+(a)] \left[\int_a^b \left(\int_a^t h(s) ds \right)^p dt \right]^{\frac{1}{p}} (b - a)^{1/q} \\ \quad \text{if } p > 1, \frac{1}{p} + \frac{1}{q} = 1; \\ [f'_-(b) - f'_+(a)] \int_a^b (b - t) h(t) dt. \end{cases} \end{aligned}$$

The first inequality in (4.13) is sharp (if $f'_-(b)$ and $f'_+(a)$ are finite).

Proof. We only prove the first inequality in (4.13).

Utilising the inequality (4.6) for $u(t) = \int_a^t h(s) ds$, we get

$$(4.14) \quad 0 \leq E(f; h) \leq 2 \cdot \frac{f'_-(b) - f'_+(a)}{b - a} \int_a^b \left(t - \frac{a+b}{2} \right) \int_a^t h(s) ds dt.$$

However, on integrating by parts, we have

$$\begin{aligned}
 & \int_a^b \left(t - \frac{a+b}{2} \right) \int_a^t h(s) ds dt \\
 &= \int_a^b \left(\int_a^t h(s) ds \right) d \left[\frac{1}{2} \left(t - \frac{a+b}{2} \right)^2 \right] \\
 &= \frac{1}{2} \left(t - \frac{a+b}{2} \right)^2 \int_a^t h(s) ds \Big|_a^b - \frac{1}{2} \int_a^b \left(t - \frac{a+b}{2} \right)^2 h(t) dt \\
 &= \frac{1}{2} \left[\left(\frac{b-a}{2} \right)^2 \int_a^b h(t) dt - \int_a^b \left(t - \frac{a+b}{2} \right)^2 h(t) dt \right] \\
 &= \frac{1}{2} \int_a^b \left[\left(\frac{b-a}{2} \right)^2 - \left(t - \frac{a+b}{2} \right)^2 \right] h(t) dt \\
 &= \frac{1}{2} \int_a^b (b-t)(t-a) h(t) dt.
 \end{aligned}$$

The rest of the inequality is obvious. ■
